Abstract - Many Small and Medium Enterprises (SMEs) in Pune are gradually exploring Artificial Intelligence (AI) to manage routine work, understand customers better, and make faster business decisions. Although AI can offer clear advantages, many smaller firms hesitate to adopt it because of limited funds, shortage of trained staff, weak digital systems, and uncertainty about returns. This paper reviews recent literature on AI adoption in SMEs, with a focus on Pune and the wider Indian MSME environment. It examines how tools such as chatbots, generative AI, automation software, predictive analytics, and AI-enabled customer relationship management systems are being used in areas such as marketing, sales, customer service, finance, and operations. The review finds that AI can improve productivity, customer engagement, decision-making, and competitiveness when it is introduced gradually and matched to actual business needs. At the same time, cost, lack of awareness, poor data quality, integration problems, privacy concerns, and employee resistance continue to restrict adoption. The study suggests that Pune SMEs are more likely to benefit from affordable, cloud-based AI tools, practical training, strong management support, and a phased implementation approach rather than large-scale digital transformation.

Keywords: Artificial Intelligence, AI adoption, SMEs, MSMEs, Pune, digital transformation, generative AI, chatbots, business performance, barriers to adoption, productivity, innovation.

I. Introduction

Small and Medium Enterprises form an important part of Pune's economy. They operate in manufacturing, retail, information technology, logistics, education, hospitality, professional services, and e-commerce. Many of these businesses now face growing competition, changing customer expectations, and pressure to work more efficiently with limited resources.

Artificial Intelligence has emerged as a possible solution to some of these pressures. AI-based tools can help SMEs automate repetitive tasks, respond to customers more quickly, analyse sales and customer data, prepare marketing content, forecast demand, and support better managerial decisions. Rather than replacing people completely, these tools can reduce routine workload and allow employees to focus on higher-value activities.

However, adopting AI is not always easy for smaller businesses. Unlike large companies, SMEs often have limited budgets, fewer technical specialists, and less time to test new systems. Business owners may also be unsure whether AI will actually improve profits or whether it will create additional costs and complexity. Concerns related to data privacy, employee acceptance, and integration with existing software further affect adoption decisions.

II. Methodology

This review is based on recent research articles, industry reports, case studies, and publications related to AI adoption among SMEs and MSMEs in India, with special attention to Pune.

Inclusion criteria

- Studies published mainly between 2024 and 2026.
- Research related to AI adoption, digital transformation, generative AI, automation, chatbots, or AI-enabled decision-making.
- Studies focusing on SMEs, MSMEs, small businesses, or entrepreneurial firms.
- Publications that discuss opportunities, barriers, business performance, implementation challenges, or adoption drivers.
- Priority given to studies connected with Pune, Maharashtra, or the Indian SME sector.

Method

- Relevant papers and reports were identified through academic databases, industry publications, and local business reports.
- Abstracts, objectives, methodologies, findings, and recommendations were reviewed.
- Common AI applications, adoption barriers, and business outcomes were identified.
- Findings from Pune-specific studies were compared with broader Indian and international SME research.
- The final review highlights practical implications for SME owners, managers, policymakers, and technology service providers.

III. Literature Review

Artificial Intelligence (AI) has emerged as a transformative force for Small and Medium Enterprises (SMEs) and Micro, Small and Medium Enterprises (MSMEs) worldwide, enabling automation of routine tasks, improved decision-making, enhanced customer engagement, and greater operational efficiency. In the Indian context, where MSMEs contribute nearly 30% to GDP and employ

over 110–230 million people, AI adoption is increasingly viewed as essential for competitiveness, yet remains uneven due to resource constraints.

A. AI Adoption Trends among Indian SMEs and MSMEs

Recent studies indicate rising interest and early-stage adoption of AI tools among Indian SMEs. A CII–ISB study reported that 65.8% of surveyed MSMEs use some form of AI tools, primarily for business communication, content creation, and training, although only 21% have deployed integrated business software such as ERP systems . LinkedIn's 2025 SMB research found that approximately 9 in 10 Indian SMBs are investing in or planning AI adoption, with Pune emerging as a strong adopter: 92% of Pune SMBs are already using or intending to integrate AI tools. In Pune, priorities include operational efficiency and cost management, with high usage of AI for workflow automation (around 94%), analytics (96%), and marketing/sales functions (over 90%).

World Economic Forum's AI Playbook for India's MSMEs estimates that wider AI adoption could unlock more than $490–500 billion in economic value for the sector. NASSCOM reports similarly highlight that while tech SMEs show growing engagement with generative AI and digital services, overall adoption among broader MSMEs remains largely reactive and pilot-oriented, constrained by unclear ROI and talent gaps.

B. Key AI Applications in SME Operations

Literature identifies several practical AI applications suited to resource-constrained SMEs:

- **Chatbots and conversational AI**: Widely used for customer service, especially via WhatsApp Business and regional-language bots. These tools reduce response times from hours to seconds, support multi-language interactions, and lower the cost of handling routine queries.
- **Generative AI**: Employed for content creation, marketing copy, product descriptions, catalogue generation, and internal documentation. Studies note its democratising effect, allowing SMEs to produce professional materials without large creative teams.
- **Predictive analytics and automation**: Applied in demand forecasting, inventory management, sales targeting, and process automation. Manufacturing SMEs use computer vision and edge AI for quality inspection, while service firms leverage AI for lead scoring and CRM enhancement .
- **AI-enabled CRM, finance, and operations tools**: Cloud-based solutions support customer relationship management, invoice reconciliation, risk assessment, and basic predictive maintenance, often delivered through affordable SaaS models.

These applications are typically introduced in a phased, modular manner rather than through large-scale digital overhauls, aligning with the limited budgets and technical capacity of most SMEs.

C. Opportunities and Business Impact

Evidence consistently shows positive performance outcomes when AI is successfully adopted. AI adopters among Indian manufacturing SMEs demonstrate higher operational efficiency (approximately 23% higher scores) and competitive advantage compared with non-adopters. Reported benefits include:

- Productivity gains and reduced repetitive workload, freeing employees for higher-value activities.
- Improved customer engagement and faster response times.
- Lower customer acquisition costs and better targeting in marketing and sales.
- Enhanced decision-making through data-driven insights.
- Cost optimisation in operations and administration.

Generative AI and automation are particularly noted for enabling SMEs to operate with greater sophistication despite lean teams, supporting scalability in marketing, sales, and customer service. Local initiatives such as the MCCIA AI Experience Studio in Pune have demonstrated practical productivity improvements among participating MSMEs through hands-on application of accessible AI tools.

D. Barriers and Challenges to Adoption

Despite the potential, multiple interrelated barriers restrict widespread and effective AI adoption among Indian SMEs, including those in Pune:

- **Financial constraints**: High perceived costs of tools, infrastructure, training, and integration remain the most frequently cited obstacle. Many MSMEs find initial investment prohibitive.
- **Skill and awareness gaps**: Limited technical knowledge among owners and employees, shortage of AI-ready talent, and low awareness of suitable, affordable tools.
- **Organizational and cultural factors**: Lack of top-management support, employee resistance to change, fear of job displacement, and uncertainty about ROI.
- **Data and infrastructure issues**: Poor data quality, inadequate digital systems, integration difficulties with legacy processes, and concerns over data privacy and compliance (including under the DPDP Act).
- **Other constraints**: Vendor lock-in risks, limited access to sector-specific solutions, and difficulty moving from pilots to scaled implementation .

Ganguly et al applied the Technology–Organisation–Environment (TOE) framework and identified top-management support, change resistance, knowledge gaps, resource limitations, and uncertainty about benefits as key interlinked barriers. Similar findings appear across manufacturing and service SME studies.

E. Synthesis and Context for Pune SMEs

Collectively, the literature indicates that AI offers clear opportunities for productivity, customer engagement, and competitiveness, particularly through affordable cloud-based and generative tools. However, adoption remains partial and uneven. While awareness and experimentation have increased significantly between 2024 and 2026, deep integration and measurable business impact are still limited for many smaller firms. Pune-specific data suggest relatively high intent and early adoption compared with some other cities, yet the same structural barriers—cost, skills, data readiness, and organisational readiness—persist.

Existing research is stronger at the national level or focused on manufacturing/tech SMEs; detailed, sector-diverse, and Pune-centric examinations of awareness levels, combined barrier effects, practical business outcomes, and gradual adoption strategies remain relatively scarce. This gap provides the foundation for the present review, which focuses on opportunities, challenges, and business impact of AI tools for SMEs operating in the Pune ecosystem.

IV. COMPARATIVE ANALYSIS

Study	Focus / Context	Key Opportunities & Impact	Major Barriers Identified
Ganguly et al.	Indian MSMEs; TOE framework analysis of interlinked barriers	Highlights need for strong management support and knowledge building to unlock AI benefits	Top-management support, change resistance, knowledge gaps, resource limits, ROI uncertainty
Manufacturing SMEs study	450 Indian manufacturing SMEs; TOE + RBV frameworks	AI adopters show ~23% higher operational efficiency and stronger competitive advantage	Financial constraints, skill shortages, organisational and data readiness issues
CII–ISB Study	Survey of Indian MSMEs on AI tool usage and digital maturity	65.8% use some AI tools (mainly communication, content creation, training); limited deep integration (21% ERP)	Cost of tools and integration, limited technical capability for advanced systems
LinkedIn India SMB Study	Indian SMBs with city-level data including Pune	92% of Pune SMBs already using or planning AI; strong uptake in automation (94%), analytics (96%), marketing/sales (>90%)	Focus on cost management and efficiency; underlying skill and infrastructure gaps remain
Rajaram & Tinguely; Rajput	Generative AI and chatbots/automation for SMEs and Indian MSMEs	GenAI enables professional content with lean teams; chatbots cut response times and support multi-language customer service	Awareness gaps, data quality, integration with existing processes, and privacy concerns

V. RESEARCH GAP

Although several studies have examined the adoption of Artificial Intelligence in businesses, there is still limited research focusing specifically on its adoption among Small and Medium Enterprises (SMEs) in

Pune. Existing literature largely discusses AI adoption at a general level or focuses on large organisations, leaving the experiences and requirements of smaller businesses less explored.

The major research gaps identified are:

1. **Limited Pune-Specific Research:** Most existing studies focus on AI adoption at the national or international level. There is comparatively less research examining how SMEs in Pune are adopting AI tools across different business sectors.
2. **Lack of Awareness and Understanding:** Limited attention has been given to understanding the awareness level of SME owners and employees regarding different AI tools, their applications, and their potential business benefits.
3. **Insufficient Understanding of Adoption Challenges:** Although factors such as high implementation costs, lack of technical knowledge, and data privacy concerns are commonly discussed, their combined influence on AI adoption among Pune-based SMEs requires further examination.
4. **Limited Assessment of Business Impact:** There is a need for a better understanding of how AI adoption contributes to practical business outcomes such as productivity, customer satisfaction, operational efficiency, cost reduction, and decision-making.
5. **Lack of Practical Adoption Strategies:** Existing research provides general recommendations for digital transformation, but more attention is required towards affordable, accessible, and gradual AI adoption strategies suitable for SMEs with limited financial and technical resources.

Therefore, this study attempts to address these gaps by reviewing existing literature on AI adoption among SMEs, with particular emphasis on Pune. It examines the opportunities offered by AI tools, the challenges that restrict their adoption, and their potential impact on business performance. The study also highlights practical approaches that can help SMEs adopt AI technologies according to their business needs and available resources.

VI. CONCLUSION

Artificial Intelligence is gradually becoming an important technology for improving business operations and decision-making. For Small and Medium Enterprises in Pune, AI provides opportunities to improve productivity, reduce repetitive work, enhance customer engagement, and strengthen their competitive position in the market.
The study highlights that AI tools such as chatbots, generative AI, predictive analytics, automation software, and AI-enabled customer relationship management systems can support different business functions, including marketing, sales, finance, customer service, and operations. Their effective implementation can help SMEs manage resources more efficiently and respond to changing customer expectations.
However, the adoption of AI among SMEs continues to face several challenges. Limited financial resources, lack of skilled employees, insufficient awareness, poor data quality, integration difficulties, and concerns regarding data privacy remain important barriers. These challenges indicate that simply introducing AI tools is not enough; businesses must also develop the necessary knowledge, infrastructure, and employee readiness to use them effectively.
The study concludes that SMEs in Pune should focus on adopting affordable and user-friendly AI solutions that match their actual business requirements. Providing practical employee training, improving digital infrastructure, encouraging management support, and implementing AI gradually can make the adoption process more effective and manageable.
Overall, AI adoption presents significant opportunities for the growth and development of SMEs in Pune. With proper planning, awareness, and resource management, AI can become a valuable tool for improving business efficiency, encouraging innovation, and achieving long-term competitiveness. Rather than viewing AI as a technology limited to large organisations, SMEs should consider it a practical opportunity to strengthen their business operations and prepare for future digital developments.
